

# Air displacement units

## Air displacement units SD-1

#### **Application**

Air displacement units are suitable for both industrial and comfort air conditioning applications. They are suitable for rooms characterised by high heat loads or heavy air pollution. Air displacement units supply air at large flow rates (up to 10.000 m<sup>3</sup>/h), at low air velocities (in the range from 0.1 to 0.3 m/s). Supplied air forms a so called »fresh air pool« in the occupied zone. Air is lifted in convection currents from heat sources to the ceiling layer, from which it is extracted from the room. In this way, even temperature field is maintained in the room, free of draught. Diffusers can be installed suspended from the ceiling, standing on the floor or hanging immediately above the occupied zone.

#### **Description**

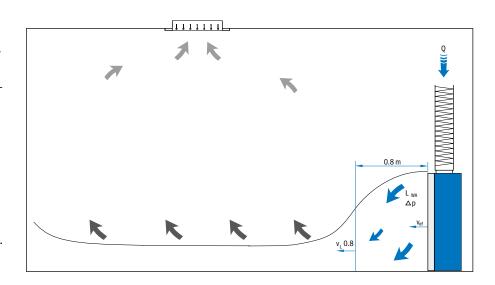

Air displacement units are made of sheet steel and painted in RAL 9010. They can be coloured in any other RAL colour at to the customer's request. They consist of a mantle, a bottom plate and a top plate equipped with an inlet spigot. The standard shape of the spigot is round. At the customer's request, it can be rectangular according to the dimension of the unit.

The air displacement unit mantle perforation is designed according to the version. The versions without a filter (F1, F2 and F5) have mantle perforation with round openings ( $\phi$  5.5 x 8 mm, 37 % free area). The versions with a filter (F3, F4 and F6) have square openings (10 x 10 x 2 mm, 69 % free area).

To achieve a uniform distribution of air across the entire displacement surface, versions F3, F4 and F6 are recommended.

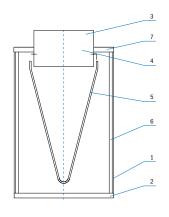

SD-1: corner

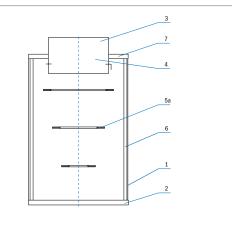

#### **Definition of symbols**

$Q (m^3/h)$ $v_L (m/s)$	Air flow rate Supplied air velocity at the throw distance L=0.8 m	$\Delta t_L(K)$	Temperature difference between air jet and room temperature
<b>v</b> <sub>ef</sub>	Effective dishcarge air velocity	$\Delta p_t$ (Pa) L <sub>WA</sub> (dB(A))	Pressure drop Sound power level
$\Delta \mathbf{t_z}(\mathbf{K})$	Temperature difference between supply and room air		

- 1. Perforated mantle
- 2. Bottom plate
- 3. Round inlet spigot
- 4. Control flap
- 5. Cone-shaped filter bag
- 5a. Dividing rings
- 6. Filter
- 7. Top plate

#### **Versions**

F1: without filters

F2: with the filter bag

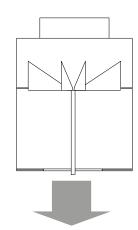

**F3:** with the peripheral filter

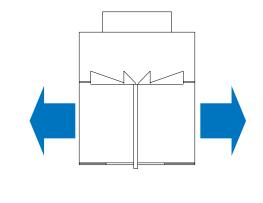

**F4:** with the filter bag and the peripheral filter

F5: without filters and jet dividing rings

**F6:** with the peripheral filter and dividing rings

**(R1)** Air jet direction adjustment with blades (available with F1 and F5 version only).

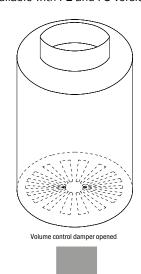

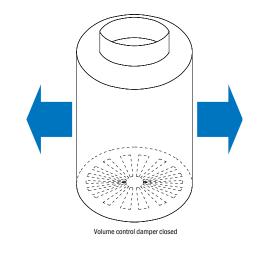

#### **Special SD-3 version**

An air displacement unit with regulation R1 and R2 must be mounted under the ceiling for correct operation. On the top plate, there is a special nut for mounting on the ceiling with a threaded rod.

(R2) Air jet direction adjustment with a flow control damper (available with F1 and F3 version only).

#### Inlet spigot $\phi d_{max} = 248 \text{ mm}$

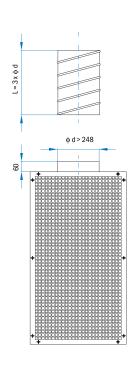

The minimum straight duct length L = 3 x  $\phi$ d before the diffuser is sufficient to stabilise the airflow at the diffuser inlet.

## Example of correct assembly of airflow regulation SD-1, 2, 3, 6

Maximum airflow  $Q_{max}$  for the chosen inlet spigot with a size of  $\varphi d$  has been calculated for the maximum recommended air velocity in the spigot of V = 5 m/s. Optimum air velocity in the spigot is 2 – 3 m/s.

#### Pressure drop and noise level diagram:

#### **Definition of symbols**

Q (m³/h) Air flow rate

 $v_L$  (m/s) Supplied air velocity at the throw distance L=0.8 m

 $\Delta p_t(Pa)$  Pressure drop L<sub>WA</sub> (dB(A)) Sound power level

#### **Example calculation**

 $Q = 2000 \text{ m}^3/\text{h}$ 

We select size 1000; H = 1500

 $A_{ef} = 0.718 \times 1.5 \times 0.6944 = 0.748 \text{ (m}^2\text{)}$ 

 $v_{ef} = Q / (A_{ef} x 3600) = 2000 / (0.748 x 3600) = 0.74 m/s$ 

 $L_{WA} = 42 \text{ dB(A)}$ 

Pressure drop:

Tip F3

 $\Delta p_t$  = from the diagram x KF (za H = 1500) = 230 x 0.33 = 75.9 Pa

Tip F1

 $\Delta p_{t}$  = from the diagram x KF (za H = 1500) = 230 x 0.28 = 64.4 Pa

Tin F4

 $\Delta p_t$  = from the diagram x KF (za H = 1500) = 230 x 0.38 = 87.4 Pa

Free area A<sub>ef</sub>:

 $A_{ef}$ = L x H x 0.6944 (m<sup>2</sup>) L-from the table

 $A_{\text{eff}}$  L x H x 0.37 (m²) for the versions F1, F2 and F5 (without filter) and mantle perforation with round openings
