

Air displacement units

Air displacement units

SD-2

Application

Air displacement units are suitable for both industrial and comfort air conditioning applications. They are suitable for rooms characterised by high heat loads or heavy air pollution. Air displacement units supply air at large flow rates (up to 10.000 m³/h), at low air velocities (in the range from 0.1 to 0.3 m/s). Supplied air forms a so called »fresh air pool« in the occupied zone. Air is lifted in convection currents from heat sources to the ceiling layer, from which it is extracted from the room. In this way, even temperature field is maintained in the room, free of draught. Diffusers can be installed suspended from the ceiling, standing on the floor or hanging immediately above the occupied zone.

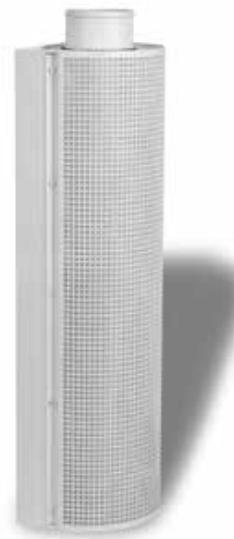

Description

Air displacement units are made of sheet steel and painted in RAL 9010. They can be coloured in any other RAL colour at to the customer's request. They consist of a mantle, a bottom plate and a top plate equipped with an inlet spigot. The standard shape of the spigot is round. At the customer's request, it can be rectangular according to the dimension of the unit.

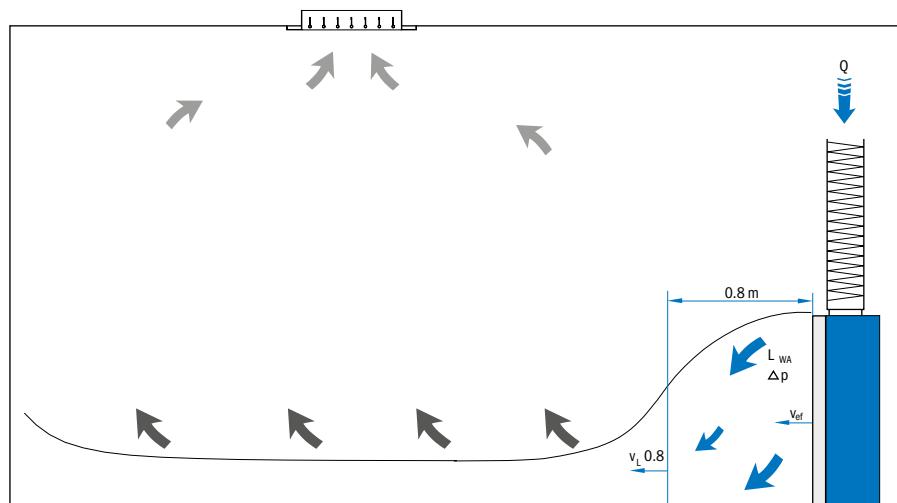

The air displacement unit mantle perforation is designed according to the version. The versions without a filter (F1, F2 and F5) have mantle perforation with round openings (ϕ 5.5 x 8 mm, 37 % free area). The versions with a filter (F3, F4 and F6) have square openings (10 x 10 x 2 mm, 69 % free area).

To achieve a uniform distribution of air across the entire displacement surface, versions F3, F4 and F6 are recommended.

SD-2

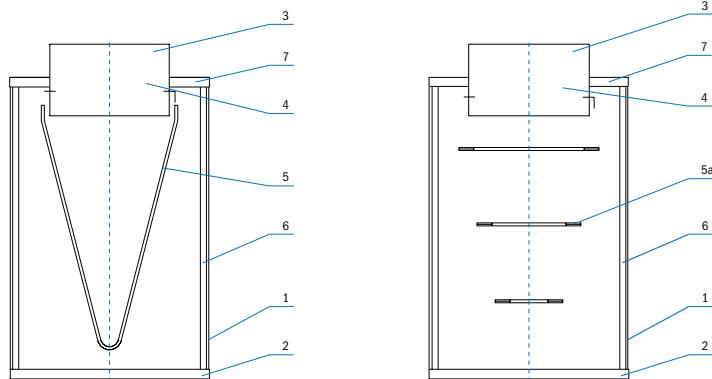

SD-2: semi-cylindrical

Definition of symbols

Q (m³/h)	Air flow rate	Δt_L(K)	Temperature difference between air jet and room temperature
v_L (m/s)	Supplied air velocity at the throw distance L=0.8 m	Δp_t (Pa)	Pressure drop
v_{ef}	Effective discharge air velocity	L_{WA} (dB(A))	Sound power level
Δt_z(K)	Temperature difference between supply and room air		

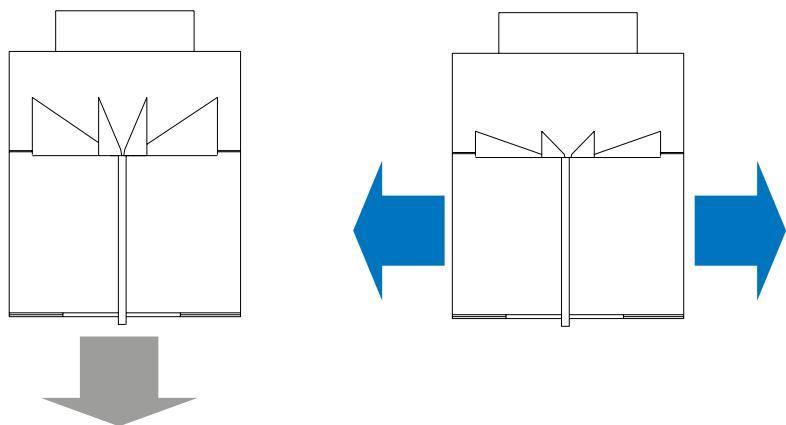

- 1.** Perforated mantle
- 2.** Bottom plate
- 3.** Round inlet spigot
- 4.** Control flap
- 5.** Cone-shaped filter bag
- 5a.**Dividing rings
- 6.** Filter
- 7.** Top plate

Versions

- F1:** without filters
F2: with the filter bag
F3: with the peripheral filter
F4: with the filter bag and the peripheral filter
F5: without filters and jet dividing rings
F6: with the peripheral filter and dividing rings

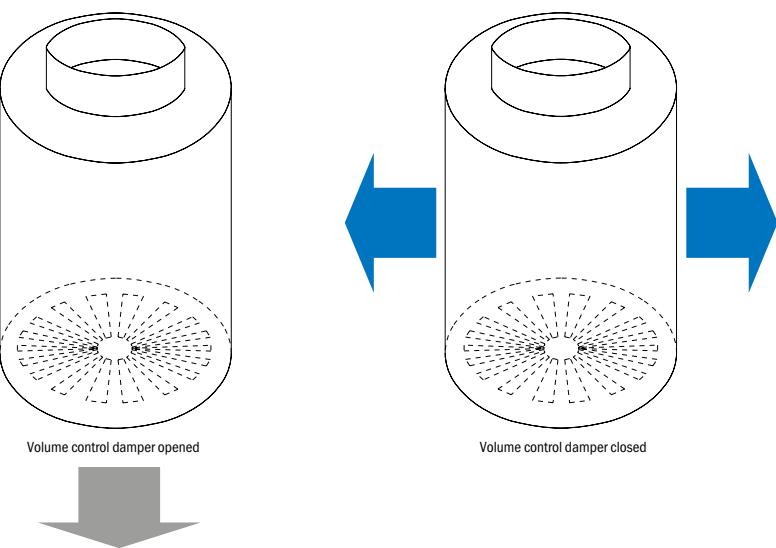

(R1) Air jet direction adjustment with blades
 (available with F1 and F5 version only).

Special SD-3 version

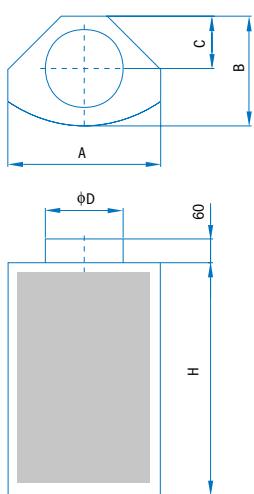

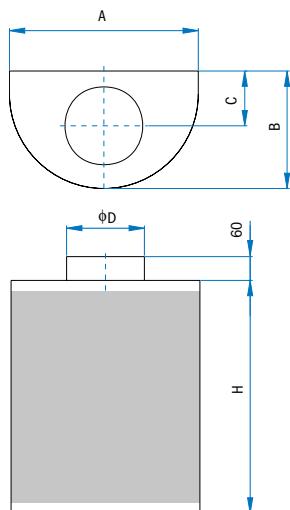

An air displacement unit with regulation R1 and R2 must be mounted under the ceiling for correct operation. On the top plate, there is a special nut for mounting on the ceiling with a threaded rod.

(R2) Air jet direction adjustment with a flow control damper
 (available with F1 and F3 version only).

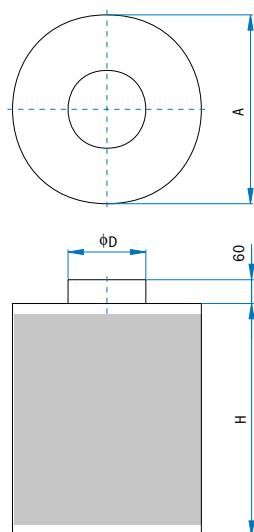

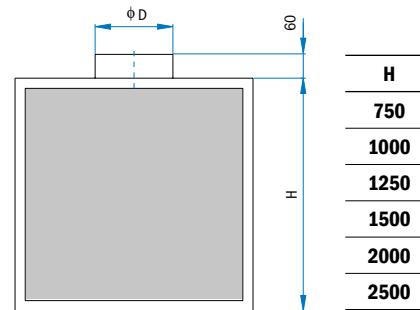

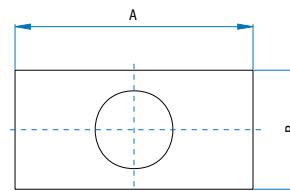

Volume control damper opened

Volume control damper closed

Definition of symbols

- Q (m³/h) Air flow rate
- v_L (m/s) Supplied air velocity at the throw distance $L=0.8$ m
- Δp_t (Pa) Pressure drop
- L_{WA} (dB(A)) Sound power level

Example calculation

$$Q = 2000 \text{ m}^3/\text{h}$$

We select size 600; $H = 1500$

$$A_{ef} = 0.92 \times 1.5 \times 0.6944 = 0.958 \text{ (m}^2\text{)}$$

$$v_{ef} = Q / (A_{ef} \times 3600) = 2000 / (0.958 \times 3600) = 0.58 \text{ m/s}$$

$$L_{WA} = 45 \text{ dB(A)}$$

Pressure drop:

Tip F3

$$\Delta p_t = \text{from the diagram} \times KF \text{ (za } H = 1500) = 60 \times 0.32 = 19.2 \text{ Pa}$$

Tip F1

$$\Delta p_t = \text{from the diagram} \times KF \text{ (za } H = 1500) = 60 \times 0.25 = 15 \text{ Pa}$$

Tip F4

$$\Delta p_t = \text{from the diagram} \times KF \text{ (za } H = 1500) = 60 \times 0.39 = 19.5 \text{ Pa}$$

Free area A_{ef} :

$$A_{ef} = L \times H \times 0.6944 \text{ (m}^2\text{)} \quad L \text{-from the table}$$

$A_{ef} = L \times H \times 0.37 \text{ (m}^2\text{)}$ for the versions F1, F2 and F5 (without filter) and
mantle perforation with round openings
